

TableIT – Create tables with ease

To create tables is a very time-consuming work. Now TableIT allows you to create user defined tables in ACT!. With TableIT you can create new tables for contacts, groups or companies – so you easily can show as much additional information as you want and keep them up-to-date.

TableIT is classified into two categories:

1. Administration of the tables: Creation and modification of the tables
2. User functionality: Notification and editing of data

ACT! itself offers no option for the user to access additional tables. Therefore every working place data of additional tables needs an installation of TableIT.

With **TableIT** you can add, create and delete user defined tables for contacts, groups and companies. You also may define field access and safety settings for users and teams. Furthermore you can connect groups, companies and quotations. You can also edit the visibility of user defined tables for each user and team.

Among other things you may design formula layouts to show your favorite data graphically. You can also design an individual (ACC) logo through many scopes of design.

Highlights of TableIT

- Create and administer tables with individual fields in ACT! by yourself
- Create, modify or delete fields or user defined tables of contacts, groups and companies
- Configuration of visibility of user defined tables for every user and table
- Define the access to fields and safety settings for users and teams and link contacts
- Establish relationships between contacts, groups and companies
- Establish relationships of individually created tables – also of sub-tables
- Create contact-, group- or company-look-ups and modify the field design through definitions and conditions
- Export list views into Microsoft Excel
- Create documents, templates and calculations
- Search function within a table with a result filter
- Combine **TableIT** with other add-ons:
 - Import IT: Import your data directly into your table
